

General Masiello at the Demonstration of the "IMPERIO" System: Towards a Digital Future for the Army

Published on 14/03/2024

In a significant moment for the technological evolution of the Armed Forces, the General of the Army Corps Paratrooper Carmine Masiello, Chief of Staff of the Army, recently participated in a demonstration of the Command and Control system "IMPERIO". The event took place at the Department of Operational Experimentation and Integration of the Ce.Si.Va, highlighting the relevance of digital transformation in the military field.

"IMPERIO", already operational in several allied nations and configurable for multi-domain operations, emerges as an important tool in strengthening Command and Control capabilities. Through simulation, "IMPERIO"'s abilities to optimize decision-making and operational processes were highlighted.

Specifically, through capacitive simulation, the system's capabilities related to efficiency in a digitalized Brigade command environment were clearly demonstrated, as well as its potential to effectively integrate with various other Command and Control systems.

During the presentation, General Masiello emphasized the need to quickly adopt a culture that embraces technological progress, essential to face the increasing complexities of global security scenarios. He highlighted the importance of developing technologies that, in synergy with training based on solid values, elevate the operational and preparedness standards of the Army.

In conclusion, the Chief of Staff recognized "IMPERIO" not only as a technological advancement but as a crucial step towards adapting the Army to future challenges, emphasizing how the integration between innovation and tradition is vital for the success and effectiveness of military missions. The event reaffirms the Army's commitment to incorporating cutting-edge technological solutions, thus ensuring an effective and timely response to contemporary operational needs.
